

**The “Etherton Mansion” in the rolling hills of Kentucky has Thermo-shield Interior on all walls and ceilings.**

**This “dream home” has over 22,000 square feet of sheet rock within its walls. All covered with Thermo-shield Interior.**

**With all the walls painted, the owner, painters and construction workers were “baking” inside the home. With air temps in the 90’s the temperature inside was near 100 degrees. And the home owner was “questioning his choice of Thermo-shield”.**

**The day after the ceilings were covered in Thermo-shield, with the same temperature outside, the home stayed in the 70's inside. "It was like night and day difference. We used an infrared temperature gun to check. Outside air temps of 90 produced 140 degrees on the roof, but upstairs the temperature of the ceiling was only 72.5 degrees. The temperature at the floor in the same room was 72. Now I'm a believer."**
